

THE HUNTINGTON SOCIETY OF CANADA (HSC) ANSWERS QUESTIONS REGARDING THE APRIL 24th IONIS-HTTRx ANNOUNCEMENT

On April 24th, 2018, Ionis Pharmaceuticals made an announcement about the Phase 1/2 clinical trial of their huntingtin-lowering drug, IONIS-HTTRx (RG6042). The news was shared publicly in a [press release](#) and the data was highlighted at the American Academy of Neurology (AAN) Annual Meeting.

**FREQUENTLY
ASKED
QUESTIONS**

What did the press release say?

Mainly, it restated what we already know: the drug is safe, and it lowered levels of huntingtin, the protein that harms brain cells in Huntington disease (HD). The newest information, presented on April 24th, is that overall, participants with lower huntingtin levels also did a bit better on clinical exams that test HD symptoms. However, the study was only designed to be sure of safety, not efficacy, so a larger trial still needs to be conducted.

So are they saying that the drug worked?

It's not possible to draw that conclusion right now. All we know is that it's safe and landed on the genetic target it was designed to hit. The clinical findings shared by Ionis are exploratory – the trial only involved 46 participants in total, which is not enough to be sure it could help with symptoms. Even though the overall conclusions are very promising, the statistics have not yet shown a clinical benefit.

What's next? Does this knowledge change anything going forward?

No. Ionis is passing the torch on to Roche Pharmaceuticals, a larger company that is invested in the HD community. An experienced international team has been assembled and is tasked with the planning and coordination of a global Phase 3 clinical trial. You can read their most recent message to the community [here](#). In the meantime, we're encouraged that the analysis of the Phase 1/2 data continues to show promising results. We're also really excited that these results are being given the spotlight at international research conferences. This will positively impact families by raising awareness of HD among medical professionals worldwide.

If it's so promising, what's the holdup?

Ensuring that drugs are safe and effective is a time-consuming and heavily regulated process. Roche has a lot of work to do, including designing the trial with care, identifying the medical teams and facilities that will take part, making sure that professionals are equipped and trained to administer the drug, producing the drug itself, and sorting out funding and regulations at different agencies worldwide. All of these steps require planning, paperwork, and patience. Rest assured that there are smart and compassionate minds involved, including patients and families with HD, working to bring this drug to the clinic as quickly as possible.

Can I sign up to be in the trial, or put my name on a list?

Unfortunately, no. The way that clinical trials usually recruit is through existing doctor-patient relationships, where the doctor decides if a patient might be eligible, and makes a referral. That’s one reason why HSC encourages people to see an HD expert at an HD or Movement Disorders clinics with a research interest, and to join [Enroll-HD](#) where available.

There’s been an outpouring of folks who are ready to take a big leap and participate. The trial is not at that stage yet, and HSC is not in control of any aspect of the design, participation, or eligibility. There will be fewer “spots” than willing participants, which will understandably lead to some disappointment. We do not encourage people to consider a big life shift (like moving) based on their desire to participate in a trial.

However, we are thrilled about the community’s engagement and we’ll continue to provide and interpret any new information we hear. There may be other research opportunities near you, as well – check out www.huntingtonsociety.ca/clinical-trial-locations/ for details.

What is HSC doing to support the trial and the community?

HSC staff are working very closely with members of the Roche team to ensure timely and proper information about this trial will be shared with the community as soon as it becomes available. HSC is also a founding member of the Huntington Disease Coalition for Patient Engagement (HD-COPE), which helps industry access input from patients and families. HD-COPE will help companies like Roche make sure that trial planning, measurements, and participation requirements seem reasonable to the real experts – people with HD and their loved ones.

Finally, we continue to provide trial details and contact information for participating in open research studies on www.huntingtonsociety.ca/clinical-trial-locations/. The upcoming Roche trial has not yet begun, and is not yet listed there.

When do you think this drug will be available?

That’s extremely difficult to answer. Trials can take several years, and a lot of care must be taken with this one, because it’s so important and so different from drugs that address just the symptoms of HD. We’d love to be able to say there’s a definite timeline, but this is uncharted territory and we simply don’t know. The first step is to see whether it can improve symptoms or slow down HD, and that’s the focus of the Phase 3 trial.

What can I do right now?

Make sure you’re under regular care with a doctor or team who has experience with HD, particularly one with a research interest. Follow the news at [HDBuzz](#), on our regular HSC website updates or on HSC’s social media pages. Check out www.huntingtonsociety.ca/hd-clinical-trials for research and trial opportunities. Above all, take care of yourself and those around you! In the fight against HD, family is everything.
